Recycling service for high pressure steel cylinders.

> Industrie Service | Gas cylinder disposal

High pressure steel cylinders are a sensitive problem. They belong in the hands of professionals. Not only when they are being used but afterwards, too. We know what needs to be done to dispose of high pressure steel cylinders properly – no matter whether they are full or empty, in perfect condition or damaged.

Damaged high pressure steel cylinders are normally no longer able to be transported; but this is no problem for us. We have special salvage packaging to transport them in.

Before high pressure steel containers can be recycled, the dangerous content must first be removed. We use our high temperature incineration plants to do this which are operated according to the highest environmental standards.

When it comes to disposing of high pressure steel cylinders you'll not just find us in Germany. We offer our services worldwide!

> Range

We dispose of high pressure steel cylinders for you containing gases, chemicals and other reactive substances such as propane/butane, chlorine, refrigerants (CFCs etc), hydrogen sulphide, nitrogen oxide, phosgene, metal organyl, chloro-sulfuric acid, diesel starters, and much, much more. In fact there is nothing that we won't take from you.

A full range of services ensures extra safe disposal

We collect your high pressure steel cylinders at regular intervals or on demand and, if necessary, transport them using special salvage packagings. This is the case for as well damaged high pressure steel cylinders as other problematic packaging. Once they have arrived at our plant, the gases and chemicals, which can be highly toxic, are either incinerated or treated chemically. Following this, we remove any residue left on the steel. We provide you, of course, with all necessary documents legally required.

One partner, many advantages

You are on the safe side with us. We know all the legal requirements concerning the disposal of hazardous waste and we follow them to the letter. The procedures we use for recycling gas cylinders are absolutely safe and accredited as such. At no point along the line gas can escape, even if the cylinders are damaged or corroded.
